

"Sitchin's case originates in an Akkadian cylinder seal from the third millennium B.C. found in the Vorderasiatisches Museum in (then East) Berlin

A portion of it features a six-pointed star surrounded by eleven dots of varying size; Sitchin judged that the star symbolizes the Sun and the smaller elements are supposedly planets, including the lost 12th world."

Sitchin states, Nibiru was a planet ejected from some other planetary system in outer space that was captured into our Solar System as it passed near Neptune. It became involved in a collision with a pre-existing planet where the debris of the Asteroid Belt is now. As a result of that collision, some 4 billion years ago, the Earth and the Moon came to be where they are now.

Sitchin saw the Sumerian/Akkadian texts such as Enuma Elish (also called the Babylonian Epic of Creation as not merely a mythological tale but a record of an ancient claim that Earth had been visited by Extraterrestrials, the ANUNNAKI "Those Who from Heaven to Earth Came" of Sumerian lore. Many who advocated this theory imagined that Nibiru, Planet X, was to return in spring 2003 concluding it's 3600 year anti-clockwise round trip. Sitchin later wrote that he saw Nibiru more as a metaphorical trigger for awakening to a higher consciousness.

"Nibiru is the home of the Anunnaki, the Nephilim, the Elohim, the Gods, and the Giants of the Bible; Those Who from Heaven to Earth Came. They are supposedly a Reptilian Race."

<http://www.sitchin.com>

FSR Commentary: latterly Sitchin's position was one of distancing himself from the idea of a violent or sudden return of Nibiru to our solar system. The latest information from Japanese astronomers in the following article suggests that there is definitely room for a potential Nibiru on a highly elliptical stable orbit around our sun. It could also be conceivable that Nibiru is the dead companion star to our own sun. Whatever this hidden object is, it could be entirely new and unexpected, and perhaps it could have once been a super massive collapsed object that could be parent to an attendant wormhole anomaly somewhere out there. Perhaps this fanciful hypothesis would answer why we are so well visited despite our peripheral and relatively remote unimportant geographic position in our galaxy. As to the truth behind any planet X theory, the conclusion of the following piece may draw new light onto a glaring Vatican link within the Jesuits story and the secret intrigue behind the Siloe probe myth. Was it sitting right there under our noses?

The latest research on the discovery of a planet X.

Jason Martell Xfacts.com UFOstream.com

For over 15 years, Jason Martell has been one of the leading researchers and lecturers specializing in ancient civilization technologies. In addition to his research, Mr. Martell is a computer programmer and senior software developer having worked with leading technology companies including Intel, HP, Cisco, and Blue Martini.

Recently in 2008, Japanese Astronomers at Kobe University led by Dr. Mukai (below) have plotted a planet with a diameter at least the size of earth that could exist in our solar system on a highly elliptical orbit.

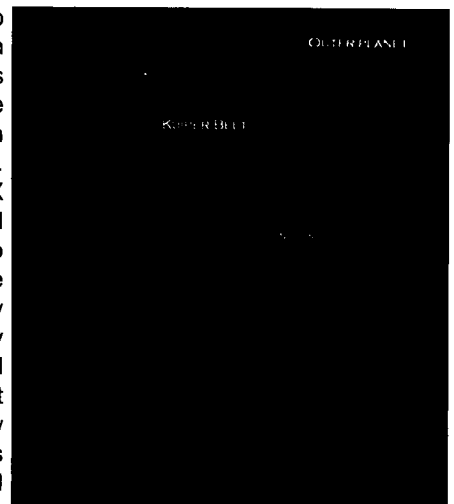

This once again raises the Astronomical community eye to the question of a planet x, another planet in our solar system beyond Pluto. Throughout modern astronomy we have references to a

cited as the cause to explain anomalies in the orbital patterns of the planets. Since the late 1980's with the research of Dr. Harrington, Planet X has been knocked back and forth as to whether or not the planet actually exists. Only recently in the year 2004 and beyond did we start to discover new "planetoid" bodies floating beyond Pluto. Some of these like Xena, or Qaorar are nothing more than large chunks or mainly ice. Not to be considered planets.

So what is so important about a planet x?

Pluto was only discovered in 1930, and even then orbital perturbations were detected which lead them to believe a yet undetected large object is still out there affecting the orbits of

advanced infrared telescopes and advanced computational mathematics are we able to finally image and pinpoint new planets in or beyond our solar system.

Interestingly enough, the first image taken of a planet around another sun (not ours) by the Hubble Telescope filmed a planet on a highly elliptical orbit around its sun. Until this footage, astronomers had never seen a planet on such a highly elliptical orbit. This led astronomers to ask how such a planet would extend so far into the depths of space and still continue its orbit back in our direction.

Could planet X have killed the Dinosaurs, what is the Nemesis theory?

When we pointed Hubble at newly discovered solar systems, an interesting pattern seemed to emerge. Almost 90% of external solar systems had "2 suns", a binary solar system. Immediately the idea of a "planet X" in our solar system started to seem more plausible with the idea that we too could have 2 suns (binary). However, our "other sun" is a failed star or Brown dwarf. Due to the immense dust clouds and debris in space, we have not been able to properly image this star. However the research presented by Dr. Muller at Berkley suggested Nemesis. He projected a large planet that orbited this failed sun dislodged comets in the Oort cloud sending that debris towards earth inevitably killing the dinosaurs.

How do astronomers go about looking for a planet x and who are these people?

One of the latest space telescopes deployed is called SIRTFF - space infrared telescope facility, recently renamed as Spitzer. This telescope is special in that it is kept below freezing temperatures and is able to tune its infrared capability in such a way as to match the temperature of these so called "dust clouds" deep in space allowing for a never seen clarity deep into space.

John Carr of the Naval Research Laboratory, Washington, and Joan Najita of the National Optical Astronomy Observatory, Tucson, Arizona have developed a new technique using Spitzer's infrared spectrograph to measure and analyze the chemical composition of the gases within proto-planetary disks. These are flattened disks of gas and dust that encircle young stars. Scientists believe they provide the building materials for planets and moons and eventually, over millions of years, evolve into orbiting planetary systems like our own.

What ancient knowledge is recorded about a planet X?

What most astronomers looking for planet x don't know, is that an ancient civilization over 6,000 years old also knew about another planet in our solar system. This ancient civilization produced over 100 of the 1st's for modern civilization and was found in where today's modern day Iraq is now located. The Sumerian Culture located in the land also known as Mesopotamia, Babylon, but originally called Sumer is today's Iraq. This amazing civilization had not only invented writing and mathematics, but had some of the most advanced astronomical data recorded that has been found to exist in the form of a written language and stone artefacts with pictograms.

What are the effects "Planet X" may have caused in the past?

Following in the footsteps of the Sumerian stone tablets, planet x is described to have initially passed by earth billions of years ago disturbing the outer planets. On one of its passes the main moon of Nibiru hit earth cracking half of the planet into what we now call the asteroid belt. In a recent report

times (4,000 years ago?), planet x passed by earth causing gravitational effects to earth which caused part of the ice sheet in Antarctica to crack off significantly raising the water levels world wide instantly. The great flood. There is an actual Sumerian tablet stored in the British museum labelled the "flood tablet" which discloses this very tale.

Who were the Sumerians and what did they say about planet x?

The Sumerians are the first recorded civilization on earth. They invented writing, math, agriculture, medicine, courts, law, judges, schools, and even astrology and astronomy. They were master astronomers having cited the distance between the planets and even the correct colours of the outer planets. This should not even be possible without the aid of telescopes from a 6,000 year old civilization.

They recorded (accurately) all the planets we know of but included an additional planet which they called "Nibiru". They said our solar system has (12) members in that they counted the nine planets plus our sun (10) our moon (11) and the (12th planet) which is on a highly elliptical orbit and only passes around the sun every 3,600 years.

How could the ancient Sumerians know about so much?

Who taught them? The Sumerian culture, today's Iraq, is credited with over one hundred of the firsts needed in a high civilization. They have left us thousands of cylinder seals and stone tablets which tell about their daily lives. They also recorded sacred texts on some of these tablets which tell us that if you were to ask a Sumerian man, "how do you know all this advanced math and astronomy?" They have left us an answer written in stone.

They say "all that we know, we were taught by the ANUNNAKI". The term ANUNNAKI means "those who from heaven to earth came." The Sumerians claim to have lived amongst their LIVING GODS. These ANUNNAKI taught the Sumerians how to record in stone the location from which they came. The ANUNNAKI live on the 12th planet in our solar system which is called NIBIRU.

Will planet X be returning in 2012? Will it cause global effects as it has in the past?

The only culture using 2012 as a reference to pinpoint dates in the future were the Mayans on their LONG COUNT calendar. What most people are not aware of is that the Mayans had several calendars. The LONG COUNT calendar was one of which various PREDICTIONS were said to happen but not always accurate as time has shown us. Yes, they were master astronomers, but they were NOT able to see the future. They predicted in one of the Bactoons from the Long Count that their GOD KULKUKAN was going to return on a certain date. Instead, the Conquistadors showed up and aggressively destroyed their culture and almost all of the Mayan code.

Aside from the Mayan prediction for an end of time in 2012, there is no astronomical or Sumerian reference citing planet x is anywhere near us, nor will it be anytime soon.

The amateur astronomy community has always been very good at finding new objects in our vicinity even before professional telescopes. Just look at Hale-Bopp. If a planet 4-8 times the size of earth comes anywhere near us, trust me, we'll be able to find it.

From Jason Martell: I contacted Dr. Mukai to ask about the size of Planet X he was projecting. He referred to its diameter as expected to be 10,000-16,000km (roughly the same size as the earth).

FSR Commentary: a very interesting parallel arises in Jason Martel's account of a new technique using the Spitzer telescope's infrared spectrograph to measure and analyze the chemical composition of the gases within proto-planetary disks. These are flattened disks of gas and dust that encircle young stars. Scientists believe they provide the building materials for planets and moons and

eventually, over millions of years, evolve into orbiting planetary systems like our own. Martel suggests this is the technique of choice sweeping space with an infrared telescope facility, using a precise temperature match to the "dust clouds" deep in space allowing a never before seen clarity in the search for Planet X.

Does this infra-red telescope speciality closely match the profile of the new director of the Vatican Observatory

Rev. Jose Gabriel Funes?

"Funes specializes in extra-galactic astronomy. His field of research includes the kinematics and dynamics of disk galaxies, the star formation in the local universe and the relationship between gravitational interaction and galactic activity. He studies the kinematics of stars and gas in the inner regions of disk galaxies."

On August 21st 2007 Pope Benedict XVI appointed a new director of the Vatican Observatory, **Rev. Jose Gabriel Funes** a native of Cordoba, Argentina. Funes, 43, holds a doctorate in astronomy from the University of Padua in Italy. He also studied theology at the **Jesuit-run** Gregorian University in Rome.

Vatican Observatory: "It is Possible To Believe in God and Aliens"

Believing that the universe may contain alien life does not contradict a faith in God, the Vatican's chief astronomer **Rev. Jose Gabriel Funes**, said in an interview by the Vatican newspaper L'Osservatore Romano. He was quoted as saying "the vastness of the universe means it is possible there could be other forms of life outside Earth, even intelligent ones." "How can we rule out that life may have developed elsewhere?" "Just as we consider earthly creatures as 'brother,' and 'sister,' why should we not talk about a 'extraterrestrial brother'? It would still be part of creation."

In the interview Funes said that such a notion "does not contradict our faith" because aliens would still be God's creatures. Ruling out the existence of aliens would be like "putting limits" on God's creative freedom, he said. The interview, headlined "The extraterrestrial is my brother" covered a variety of topics including the relationship between the Roman Catholic Church and science, and the theological implications of the existence of alien life.

Mailbag

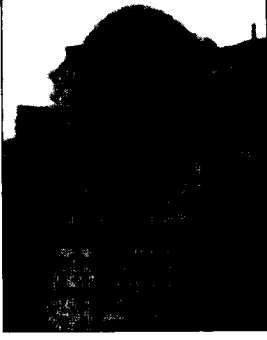

(A letter from Salvador Friexedo.)

Freixedo, a Spaniard from the North-West (Galicia), was a member of the Jesuit Order for 30 years, until confrontation with the UFO subject irrevocably altered his perspective.

Dear friends,

I am 85 years old but if my neurons are still sharp, my legs are not as agile as they were. It means that I am not running after new cases because I don't think they are important now days. We have already too many. What we need now is to analyse the global meaning for mankind of the thousands we already have and the real intentions of the invaders. I have to tell you that I have not only studied the UFO phenomenon from outside, I have lived it in my own flesh.

There are intelligent extra-human beings (incorporeal?) on our planet. For those without prejudice, the ever-increasing presence of UFOs in our skies and the mysterious and wonderful crop circles that appear in so many countries are undeniable proof. Stop being amazed at their

submitted allow us to have a more complete idea of it all; but this is already secondary. Today's phenomenon must be considered in a sociological and psychological context and related to the evolution of mankind. It is logical for us not to be able to completely understand them because they are from another dimension or other planes of existence just as animals can only understand some of our actions. They have been on our planet for millions of years. They have been here even before us. It seems that some of them are at the time coming from elsewhere. Intelligent extra-human beings among us are very diverse and have very different origins. While some seem to come from physical stars somewhat similar to ours, others give the impression of coming from other dimensions or other planes of existence which are very difficult to locate in a physical environment and very difficult to conceive for our mind, limited to a three-dimensional world. Some of these beings are capable of adopting completely human shapes that enable them to live among us without being detected.

If they are among us, if they are more intelligent than we are, and if they have been among us for such a long time it is logical to believe that they have manipulated us, still are, and used us in many ways (just like the more developed human beings have manipulated and used in a thousand ways the less developed countries). So wouldn't it be convenient to
