

The work of the Romanian Florin Gheorghita on imaging invisible orbs and anomalies.

Florin Gheorghita was FSRs longstanding Romanian correspondent from the late 1960s onwards. He was an early supporter of Sift's photographic anomalies known as globular forms. He described Sift's first dramatic encounter as thus:

In 1953, when Sift was a 17 year old student he used to go for little outings in the Baci Forest near Cluj. One day in mid-summer he saw a luminous globe fall from the sky onto a large bush, and then suddenly vanish among its branches. Rushing to the spot, and still seeing nothing there, he pushed a stick among the foliage, hoping to find some traces of what had fallen. A most disturbing thing happened, he found he could no-longer see the stick, nor could he any longer see part of his hand. He felt a tingling sensation throughout his hand and great heat in the soles of his feet. Then immediately afterwards, this was followed by the sensation of something cold pressing down upon the surface of his body.

As an engineer Florin Gheorghita wrote extensively on the hypothetically laws of globular forms. A translated, unpublished manuscript from 1991 in the FSR archive supplied the following observations:

I wish to accomodate the reader with the interesting images belonging to a parallel invisible world. In the atmosphere, both in nature and inhabited zones and even in dwellings there exists invisible moving or standing agglomerations of extremely fine particles with special energetic behaviours. These agglomerations are spherical or ellipsoidal and relatively small in diameter, from some centimetres to some tens of centimetres. Their shape and dimensions are maintained during movement even at long distances.

The material particles agglomerated in such forms possess a higher energetic level, which induces a uniform emission of radiation responsible for producing images of plasmatic globes on film. They do not belong to the visible spectrum and as they are recorded on infra-red film they must be considered long wavelengths and thus to high frequency waves. In some situations the invisible form is recorded as a transparent presence, although continuing to emit unseen radiations, it is this aspect that makes them resemble plasmatic-type structures. It is never the less possible that the effect of transparency should not depend on a certain density of particles, but on a different energy level. These plasmoids maintain a constant volume even at long distance demonstrating that the inner cohesion force is much stronger than the dissipation tendency normally exercised by atmospheric agents. The constant maintenance of plasmoid volume suggest although radiant energetic processes occur within, the thermal component is negligible.

In a certain part of the Baci Forest frequent appearances of globes left some limited carbonisations, intense impressions on films at low exposure times as well as Geiger meter readings of discrete radioactivity. The radiation of the invisible globes is very penetrating that made me think they might contain gamma-type radiations. Searching a reduced zone of the Baci Forest, where the biologist Sift found strange burns on the trees branches in 1974, they were found to have occurred from the inner to the external part. No traces of fire were found on the ground which led us to the conclusion that the globes dissipate their energy within gamma type domain yet at quite low intensities. When Italian researchers asked me what they should do in a similar zone situated in the North-Western part of Italy, I advised them to take photographs in the invisible by employing Geiger Meters. The results obtained were remarkable, several presences and displacements of radiant globes were captured exactly where the counters indicated variations of local radioactivity!

One of the most interesting manifestations of these odd globes

unknown exchange of energy occurring during the displacement between the globes and the environment. The documentary photographs, always accidental, show a very interesting rhythmic emission of radiated energy from the globes. Such a phenomenon is wholly unknown with structures of normal matter in which all radiation processes are produced continuously until exhaustion of its energetic resource. Indeed it seems that the propulsion manner of invisible globes is based on a strange energetic manifestation, after covering a small portion of the route, the inner energetic potential seems consumed and the image of each moving spheroid is extinguished, seen no more on the negative. Yet, after covering an equally short distance the spheres image appears again emitting radiation of an equal intensity to that of the previous sequence.

In this way the whole agglomeration maintains the association of its particles, perhaps by absorbing a certain form of energy, cosmic or earthly from the environment and transforming it in a very short time of extinction following its emission. Both the intensity and the colours recorded on films specific to each sphere remain unchanged after each extinction and re-ignition regardless of distance covered. The unprecedented physical phenomenon of self-feeding with energy from the surroundings through a rhythmic energetic exchange proves even more the difference between invisible spheres and balled lightning or ionized plasma which is rapidly extinguished after loosing its electrical potential.

As a matter of fact the strange rhythmic radiant manifestations of invisible globes could be considered wholly similar with some vital processes of living organisms such as breathing or heart beating. Researching the unusual behaviour of pulsing spheres, several pictures record their trajectories as parallel to one another. In some situations rhythmic lines perform varied changes of direction appearing as if according to some rigorous program. Different recordings of parallel trajectories in various airy patterns taken around the World would involve either the influence of some external energetic factors whose strange and extremely high speed variations cause those incomprehensible games or the intervention of a certain intelligence that would conduct them according to the program. On trying to select a more logical and realistic hypothesis on the behaviour of spheres an unaccustomed idea, perhaps more close to reality, would be that each globe, large or small has its own intelligence.

As if adding to the oddness of this invisible world, the existence of which is undoubtedly felt by many people, some events suggest that the intelligent globular entities would not represent a parallel world to ours. The radiant globes would actually represent the ontological prototype of a fundamental category of intelligent matter, spread not only on Earth but all over the cosmos! Yet another interesting detail is present in the cases of extraterrestrial interference, various globes having probably come to Earth from other cosmic dwellings have been seen while specifically terrestrial globes, although frequently moving about us, might only be accidentally seen. Therefore the ever enigmatic UFOs have gradually convinced us they are messengers of some more advanced extraterrestrial civilisation carry bright globes with an intelligent behaviour too! If such radiant globes, generally unseen on Earth, become visible especially when coming from another part, does this mean they represent a proto-type of the beings in our galaxy and respectively, in the whole universe? If such a hypothesis would actually be a fundamental reality it means we should wholly accept the ancient spiritualistic philosophical concept that the human being would be made of a material body as well as an invisible entity, remaining after each life in the planetary space as a radiant globe that keeps its intelligent behaviour.

A CLOSE ENCOUNTER OF THE THIRD KIND IN ROMANIA.

Dan D. Farcas

During the night of July 8 to 9, 1996, in the centre of a village, in Eastern Romania, a police sergeant and a guardian had a close encounter of the third kind. They saw a UFO hovering above the road and three humanoids around it. Some other events seem to be connected with it. The case was widely exposed in the Romanian media but it was not thoroughly investigated by UFO specialists being almost unknown abroad. (This article and the article by Ion Lazeanu were originally published in the *European Journal of UFO and Abduction Studies*, a publication which is no longer in print).

The following case was observed in the village Certesti (pronounced *Tchertzeshti*), district Galati, in South of the Moldavian Region of Romania. Only newspaper and tabloid reporters investigated the CE III in the next days and not UFO "professionals", because of the lack of funds and of appropriate UFO research structures in Romania. The TV producer Mihai Badescu, with a small team, went to Certesti, on August 12, 1996, to make a short film about this event, for TVR1, the main Romanian Public TV channel. He invited Calin Turcu and me (both of us having books published in Romanian about the UFO phenomenon) for comments. During that day, we had detailed discussions with the witnesses of this encounter and with other people, including sceptics. The main findings are mentioned below.

The police sergeant *Marian Mancu* and *Marcel Rusu*, voluntary guardian, were patrolling on the main road passing the village Certesti, on July 8 to 9, 1996, at night, in front of the police office. In this place, on both sides, between the road and the sidewalks, there are deep ditches, with small bridges across them. The houses are behind the fences, in the middle of orchards and gardens, except a two-storied apartment house, opposite the police station. The police sergeant lived in one apartment of this building. Around 00.30 AM, Mancu told Rusu that he would go home for ten minutes, to eat something. The entrance is behind the building. The moment the sergeant passed the corner, he heard a whistling sound from the street and sensed a current of air. He turned immediately back, seeing on the road something which "splashed blue and red lights, making a sound like vroom-vroom".

At the first moment the sergeant had the impression that a police car from the district capital Galati had arrived on a routine patrol. Getting closer he realized that the object was hovering half meter above the pavement and a small and very strange person was moving around it. He cried "Guard!". As an answer, he observed the horrified guardian, coming half out from the ditch where he was hiding himself, below a bridge. He whispered "Mister Marian, Satan!" Rusu declared later that immediately after the sergeant disappeared behind the apartment house, "a fluttering from the above appeared." The neon lighting of the street seemed to change in intensity. The object descended smoothly, without noise, behind him. For a short instant he was also convinced that it was the police car, on routine patrol, but turning, he became frightened when realized that the object had no contact with the ground and that three small human like creatures moving around it. As he declared "when I saw how they were, their ugliness, I told

myself in the ditch because I have never seen such things my life."

As both witnesses agreed, the object had the form of a flat craft, 5-6 metres across and 2 - 2.5 meters high, and was hovering and balancing 0.5 meters above the ground. Around the edge it had a continuous girdle of light "as a rainbow". The colours: red and blue (or green in other declarations) change between each other and flared. At the bottom of the object was a bright white light. None of the witnesses saw door, portholes or other details. After about two minutes, as the estimated, the UFO rose vertically. At that moment its light became much brighter, but the neon streetlights went out. When the object reached around 30 meters, it change direction and turned toward East, with tremendous speed. The neon light went on after not more than thirty seconds.

The guardian, Rusu, saw the humanoid creatures more clearly. Sergeant Mancu noticed only one and only from behind. The height was estimated to be around one meter, maybe less ("as

Dan Farcas, sergeant Marian Mancu

a child of six years"). Rusu said he heard some noise made by them, "like rain in a drain pipe". Both agreed the creatures gave the impression of "abortion" (in the sense of "unfulfilled development" as they mentioned later). The visitors had a big head, very elongated behind, and covered with bumps, no hair and big ears ("as a palm of a man"). Their face was white and they had big eyes. Gray scales with a metallic sheen, as fish scales, covered their

bodies. The belly was relatively big and limp. The arms were "not thicker than two fingers". None of the witnesses remembered the nose, the mouth or if they wore shoes. The witnesses could not tell for sure if the creatures were walking or flying above the ground, but accepted the second possibility as more likely. Rusu said they moved, "as if they were drunk".

The physical traces were weak. A huge sweet cherry tree nearby had around 15% of its leaves affected, as if by extreme heat on the side where the object was seen. The damage was visible even after one month, when we visited. Some people from the village told us that next morning, after the encounter many leaves and broken limbs and were spread on the road in that place. Some others were convinced that this was the result of human activity. No other signs were recorded. Nobody measured the radioactivity or took samples. Sergeant Mancu declared that, after the object disappeared he had to help Rusu to come out of the ditch. The guardian told him that he was sick and he had to sit on the grass for a while before becoming capable of walking. He remained convinced he had seen Satan. After about a quarter of an hour a tractor came up the street, driven by *Nicu Chicos*. The two asked him if he had seen something. The tractor driver finally admitted that he and another countryman *Emil Bugeac*, of the nearby village *Carlomanesti*, had seen a bright light, with some coloured blinking, in the evening before at 10.30 or 11 P.M., three kilometres away from Certesti. But it could also have been
