

A group of peasants of Gemini Mehedinpi saw an extra-terrestrial creature from another planet

Lulian Gogonea.

The mehedinbean Village of Gemeni is the place where an alien would have landed Monday morning for a few hours, after which he took flight and disappeared in the sky. At least so say the peasants. There was a

muscular man wearing a blue suit with white stripes, like the Superman movies. Other eyewitnesses said they saw him later; he flew in the upright position over houses. People did not approach him to ask him or reach him. They believed, initially, that he was a dummy put up by children.

Ana Crupan: Mr Bărbatu told me when he came from Cujmir, about the man in blue and then I said I saw him after. Standing upright, around eight. He was dressed in a dark blue costume with white stripes on the legs.

Ion Crupan (68 years) woke up around 6.30 and went out to do his chores, when he saw the extra-terrestrial that Monday. He had a blue suit, with white stripes. The head was round and had a mask. I thought is that a dummy made by children of the village. Many people in the village say that they saw a strange man. Others saw him fly when standing on top of houses. Then I was convinced that something was odd!

Aristică Găletușe in the morning, leading the cows, noticed a break in the fence there was a man in blue who had a mask on his face with white and black points. He was muscular like Superman. The man did

not harm anybody, left to him self! I was not scared I went to meet him to see what he was or talk to him.

Valerica Găletușe, is a woman of 71 years she was positive about what she saw. Opening the gate leading to geese, saw a man like a mannequin, in blue, standing in front of my house.

Constantin Toader (41 years) claims that, around 8 o'clock, he looked to the sky and what he saw shocked him. "I was not drinking, not anything and I know you see that it's not crazy. About 100 metres up in the sky was a man dressed in blue. There was no smoke or noise, the legs had some more colours.

Valerica Cristi Stoica was giving food to birds in the yard. "My husband said to me look what's on top. It was, actually, a man in blue, who flew off. Only God knows what he was.

Mayor of Dârvari, Ionel Mocanu, does not believe the story, but police took things seriously and have collected statements from all witnesses in the village: "I do not think so too, although the statements of people say that was about the same blue costume."

Police Officer John Anușă said that checks are being made with a view to explain the mystery. "I was on the spot and I took statements from seven to eight persons. It was not a tall story, because these are serious people, of different ages, men and women. All the witnesses say the same thing, namely that one strange man, who later flew over the village, was dressed in shiny blue suit. So far I do not know what he was!

Otopeni Airport, Romania, over-flown by a UFO in 2004

CCTV images of UFO were hidden until our newspaper 'Guard' insisted with the authorities that they are media. The magazine "Guard" came into possession of another recording, after the 'MIG hit' last year near Gherla. The new images, were taken from the control tower at "Henri Coanda Airport" (formerly Otopeni), in the summer of 2004. They can be found on the site www.gardianul.ro, they are regarded as genuine and are in the possession of the Ministry of Defence, SRI, the Airport "Henri Coanda" and other institutions.

They are inexplicable; they show a bright red and green object in the area at least 30 minutes. However, at certain times it moves. It is hard to believe that it is an aircraft about to land, because, according to video time codes it takes at least half an hour, during which time the plane should reach the runway.

"The images are authentic" said Sorin Stoicescu, director of the Directorate General of Civil Aviation of the Ministry of Transport in 2004. "We said that the pictures are authentic they were caught on video cameras of the Otopeni International Airport and were analysed by specialists of MAPN and SRI." According to Sorin Stoicescu, the object

UNUSUAL PHENOMENON OBSERVED WITH A RADAR DEVICE IN ROMANIA

Ion Lazeanu (ASFAN)

I was working, as senior meteorologist, at the RADAR laboratory (physics of the atmosphere) at the National Institute for Meteorology and Hydrology in Bucharest (Romania), since 1967. In the same year an English Plessey radar was installed in our Institute, the training of users being made by English and American specialists. In 1971 the Plessey device was replaced by a new installation: MRL-2, made in the former Soviet Union, the training being performed by an engineer from the manufacturer company. The radar had a range of 300 kilometres and a narrow angular opening, typical for meteorological radar devices.

The meteorological observations were performed each hour, 24 hours per day, working in shifts. During one of the routine observations, with this radar, on the night of August 1986, at 2.00 a.m., a sharp horizontal line, one cm long appeared on the screen. The position of the target remained stationary. By specific radar techniques, I determined that the distance to the object was 275-280 km southwest of our station, that is above the city of Sofia (Bulgaria), at an altitude of 30 000 meters. Through manual operations, for about 4-5 minutes, I stopped the radar beam on the "object", which remained motionless all this time. Afterwards, almost instantly, it disappeared. I found it immediately, on the same vertical, some 5000 metres lower down. I fixed the radar in this new position, continuing the observation, but after a short while it disappeared once again, this time rising into its initial position. I have good experience in observing flying objects and I have also two licenses as an airplane pilot, but this object and its movements resembled nothing I knew before.

In this period of time I was on duty by night, every four days. I had the opportunity to observe this strange "object" almost each time, during three-four weeks, in the same place. The length of the observations was varying between 3 and 20 minutes. I discovered the same object (or another, identical), above the city of Cluj-Napoca (Romania), located some 300 kilometres Northwest of Bucharest. Afterwards the object disappeared and it was impossible for me to find it, despite my efforts.

The object reappeared in February 1988, again in the area of Sofia, and again by night, between 2.00 and 4.00 a.m., my observations were made several times, the whether being good and the sky cloudless. Once again the "object" made its vertical movements. After one month, a change occurred; during one of my observations, the object disappeared suddenly, but this time horizontally; I found it more than 200 km eastward, in the area of the city of Varna (Bulgaria), after a search of one minute, but it seems that the distance was covered in a much shorter time. In the next observations I found it in this new location. When I fixed the radar beam on it, the object performed the same quick movements upward or downward. In one night, after repeating this operation several times, when I fixed once again the beam on it, the whole radar installation was disconnected spontaneously, with a muffled thud. I started it again only for the next hourly observation. After the usual operations, everything was functioning without any problem. But the "object" was visible no more. After this incident, I stopped studying the strange object. I saw it several times for a short glimpse, but I avoided stopping the device on it. I have to mention that the

After checking all the components, he told me that he did not found any explanation for the spontaneous stopping of the radar. As a matter of fact, the radar was working in the next period of time without any failure.

The dimensions of the object could be estimated by analogy. A big ship (e.g. 200 meters long), at a distance of 35-40 kilometres offshore, appears on the screen of a similar radar, installed on the coast of the Black Sea, as a horizontal one centimetre line. Taking into consideration the distance of 275-280 kilometres, the "object" could have a length of at least 1500 meters. It has to be remarked also its tremendous speed, both horizontally and vertically, as well as the property to reflect the radar beam.

NOTE - Following some comments which contest the possibility of stopping the radar device on the target, the author states that there are several types of radar and some differences between military and meteorological radars, as follows:

- The military radar transmits radio waves, with a great angular opening, to detect small targets. There are often two antennas moving horizontally and vertically. Only when they are moving they can "see" the target.
- The meteorological radars, as the MRL-2, have a small angular opening. Their purpose is to detect targets with large size and low speed (as the cloud systems). They act emitting two microsecond pulses of radio waves. When they "catch" a target, the echo of the pulses is received by the same antenna, in the same position. Unlike military radars, the meteorological ones can observe a target by being stopped on it.

Commentary by Harry Challenger: this important though historic Romanian article by Ion Lazeanu further validates the potential of weather radar to zero onto invisible UFOs. On each occasion the apparent UFO may have picked up that it was being monitored and reacted to avoid detection by moving thousands of metres in an instant. Alien craft may be routinely monitoring our cities.

In FSR 51.1 we raised the concept of using detection apparatus to filter the hypothetical compression layers in the air around cloaked UFOs, the compression causes drastic local changes in air condensation of water, something characteristic to a fingerprint for all exotic UFO including those that are cloaked silhouettes. These hypothetical findings conceivably can be picked up on visual spectral analysis, and will not be generated by conventional aircraft. The cloud ring generated by the June 1st Southampton triangle is a much more extensive rapid condensation phenomenon, but essentially the same process is potentially involved around all UFO energy fields. The future of ufology may require a dramatic period of evolutionary divergence into brand new forms of detection technology.
